

HIGH SECURITY FENCE

High Security Fencing is widely used for its strength, appearance and anti-climb/anti-attack profile. Created from 4mm galvanized/zinc-alum wire, the finger proof mesh format is produced by electrical resistance welding at each intersection. The mesh opening of approximately 8mm x 70mm, makes it extremely difficult to penetrate using conventional hand tools presenting a higher delay factor greater than that of other fencing products. Tamper proof fixings assure that panels cannot be removed from the attack side.

We provide complete fence system, including posts, fittings, etc.

Top, bottom or cross rails can be utilized to provide additional strength.

For non-military applications, that is for industrial and commercial properties, there are special posts and profiled panels available to reduce the amount of steel as compared to systems used in highest security zones.
